rfq-mm — a quote-driven RFQ market-making simulator

2026-09-09T19:41:55.587417+00:00

Why EIX is RFQ-with-reference-market, not a central limit order book

EIX (European Investor Exchange, operated by BÖAG Börsen AG at Börse Hannover) is a quote-driven RFQ venue anchored to a reference market (Xetra, for German names) — not a central limit order book. Prices form via a market-maker system (Scalable Capital Bank, mwb fairtrade) that answers client requests-for-quote off the reference market, subject to a hard regulatory cap: the quoted spread must not lie outside the current reference-market spread for the requested size, after trading, settlement and FX costs (§7(1) of the Regelwerk). There is no order book to match against; a matching engine would be building the wrong system for this venue entirely.

Markouts: the headline result

Limitations

This is a research simulator, not a reproduction of any proprietary system: EIX publishes no public market-data API and Xetra L1 is a paid product, so every RFQ arrival, client-acceptance decision, and (in synthetic mode) the entire reference order book is simulated — a documented, parameterised proxy, not real trading activity. With real data, the next steps would be calibrating arrival intensity and the informed-flow fraction against actual RFQ logs, using real L1 depth for the size-aware spread cap, and measuring the §8(2) withdrawal rate against real quote-to-acceptance latencies instead of the documented client-acceptance proxy used here.
